- *Announcements*

Review from last time (§9.6-9.13)

- User-defined types: **Records**
 - Records in **M2**
- Using Python **classes** to make records
- **Objects** are **instances** of **classes**, created by **constructor** functions
- Objects are **mutable**: **copy** vs **alias**
- Using **'id'** to check for aliases

What's on for today (Py ch12)

- Object-oriented programming paradigm
- Objects, methods, attributes
- Classes, instances
- Alias vs. shallow copy vs. deep copy

Object-oriented programming

- **Procedural** paradigm: programs as lists of **actions**
 - Focus is on the procedures (**verbs**)
 - **Variables**, data structures get passed into procedures
 - ◆ e.g.: **`string.upper('hello')`**
- **Object-oriented** paradigm: collections of **objects**
 - Focus is on the data (**nouns**)
 - **Messages** get passed between objects
 - Procedures are **methods** belonging to objects
 - ◆ e.g.: **`'hello'.upper()`**

Everything is an object

- In object-oriented programming, all data are **objects**:
 - Variables, procedures, even libraries
- We make things happen by passing **messages** between objects

- ◆ `myFile.read(16)`

- ◆ `appleName.upper()`

- The object itself defines what messages it accepts: these are called its **methods**

- e.g., **files** have `read()`, `write()`, etc.
strings have `upper()`, `len()`, etc.

Methods and attributes

- Everything you can do with an object is encapsulated in its object **definition**
 - Methods make up the **interface** to the object
- Objects can also have **attributes** (variables)
- Our fractions.py ADT example:
 - **Methods**: `get_n()`, `get_d()`, `add()`, `mult()`, etc.
 - ◆ Everything you need to interact with a Fraction
 - **Attributes**: tuple (n,d)
 - ◆ Could also have two separate attributes: num, denom

Classes and instances

- We **define** (declare) object **classes** (types)
 - **Attributes**
 - **Methods** (interface)
 - ◆ Constructor and destructor
- Then we **instantiate** the class (declare variables)
- e.g., **frac1** is a variable of type **Fraction**
 - **frac1** is the instance,
 - **Fraction** is the class

More on instantiating classes

- ◆ class Date:

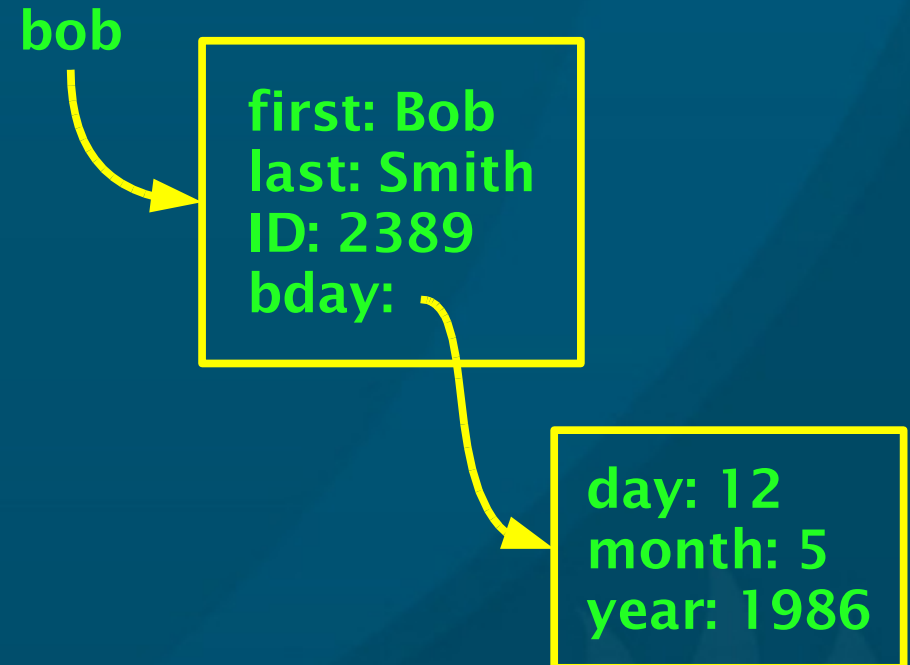

- day = 0
- month = 0
- year = 0

- ◆ class StudentRecord:

- firstName = ""
- lastName = ""
- ID = 0
- birthdate = Date()

- Creating a new StudentRecord makes a new Date:

- ◆ bob = StudentRecord()
- ◆ bob.birthdate.year = 1986

More on copy vs. alias

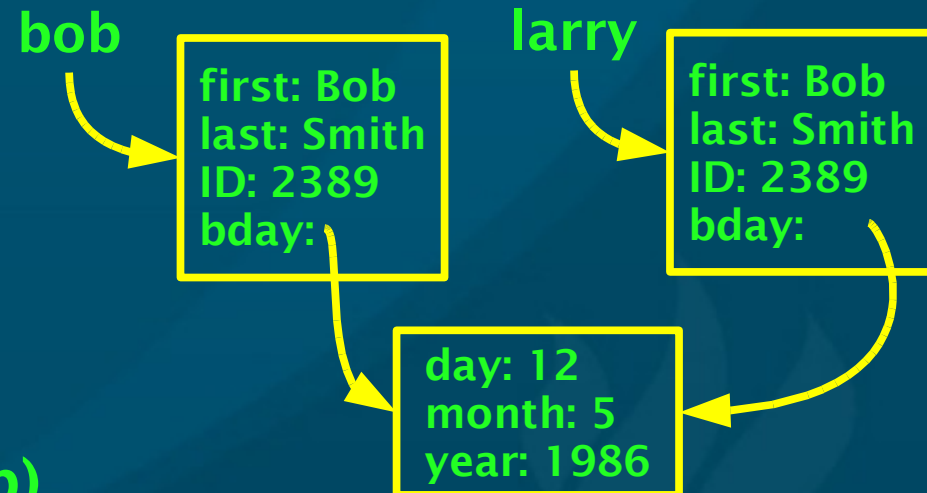

- Assignment: alias

 - ◆ `larry = bob`

- `copy.copy()`: shallow copy

 - ◆ `larry = copy.copy(bob)`

- `copy.deepcopy()`: deep copy

 - ◆ `larry = copy.deepcopy(bob)`

Review from today (Py ch12)

- Object-oriented programming paradigm
- Objects, methods, attributes
- Classes, instances
- Alias vs. shallow copy vs. deep copy

TODO

- No lab due this week!
- Lab07 due next week: Ch9 choose one:
 - #37+38: people db, matching
 - #40+41: online chequebook
 - #46: church directory
- HW08 due Wed:
 - Py ch12 # 3, 4
- Quiz08 (ch9) on Friday
- Paper topic by Mon 13Nov
