§8.0-8.3: Data Storage and Number Bases

27 Oct 2008
CMPT14x
Dr. Sean Ho
Trinity Western University

TRINITY WESTERN UNIVERSITY

Announcements

- XSLT competition:
  - Wed 5 Nov 1:00-2:30pm
  - Register by Fri 31 Oct for free tutorial
  - Orion Ifland <orion.ifland@twu.ca>
  - www.twu.ca/xsltcompetition
- Math Sciences Club event:
  - Thu 30 Oct, 1:10-2:20pm Neu 41
  - Alma Barranco, “Electronic Learning”
  - Free pizza!

Essay / Paper

- Computing scientist as **G**odly **C**hristian **L**eader:
  - Not just knowledge about tools, but
  - Wisdom of how to use tools
    - To serve others and
    - To give glory to God
- Write a short essay on a topic of your choosing about computers and society:
    - Approx 5 pages typed double-spaced 12pt 1in margins
    - Submit half-page topic by Fri 9Nov
    - Paper due last week of class (Mon 3Dec)
      - Electronic submission (email, eCourses)

Sample paper topics

- Censorship and free speech
  - Pornography, gambling, hate groups, etc.
- Violence in video games (Columbine etc.)
- Privacy: online banking, ID theft, etc.
- Blogs: effect on politics, social interaction, etc.
- File sharing: Napster, Gnutella, etc.
- Artificial intelligence: the nature of sentience
- Online dating (e.g. eHarmony): pros/cons
- Equity of access / rural digital divide
- ... come up with your own topic!

Tips for essay writing

- Your essay should be a position paper:
  - The topic should have at least two sides (e.g. pro/con)
  - You should state (in the introductory paragraph) what your position is (thesis)
  - You should have at least 2-3 points, each, both for and against your position
    - It is not necessary to rebut every point that contradicts your position:
    - Be honest about the faults/limitations of your thesis
  - Summary intro/conclusion paragraphs
  - Proper English (spelling, grammar) is important!

Ch8: Data storage and I/O

- As programmers, you're already expert users of various datatypes and file I/O
- Now we peek under the hood to see what the compiler and the OS are really doing to implement these
- Every variable we declare takes up space in memory (RAM):
  - How much space does each variable need?
  - How is our data stored?

Binary numbers

- At the lowest level, all computer data are stored using logical bits: each bit can be either 0 or 1
  - High voltage (1) vs. low voltage (0)
  - Most memory chips use a big bank of tiny capacitors: has charge (1) vs. no charge (0)
- We use groups of bits to represent data (numbers, characters, strings, etc.):
  - e.g., this pattern of eight bits: 0 1 0 0 0 0 1 1
    - Could represent the decimal number 35
    - Or it might represent the character "#"
    - Or something else – depends on how we interpret it

Number bases

- God gave us 10 fingers; so we often count in base 10:
  - "5927" interpreted as a decimal number:
    - 5 units of (10^3 = 1000)
    - 9 units of (10^2 = 100)
    - 2 units of (10^1 = 10)
    - 7 units of (10^0 = 1)
- Counting in binary is similar:
  - "0110" interpreted as a binary number:
    - 0 unit of (2^3 = 8)
    - 1 unit of (2^2 = 4)
    - 1 unit of (2^1 = 2)
    - 0 unit of (2^0 = 1)

Hexadecimal, octal

- Hexadecimal is base 16: we use 'A'..'F' to represent the "digits" ten, eleven, twelve, etc.
  - "BEEF" as a hexadecimal number:
    - B (11) units of (16^3 = 4096) => 45056
    - E (14) units of (16^2 = 256) => 3584
    - E (14) units of (16^1 = 16) => 224
    - F (15) units of (16^0 = 1) => 15
    - Total: BEEF (hex) => 48879 (dec)
- There's also octal, base 8:
  - only the digits 0..7 are used

Using bases in Python

- Python has special notation for expressing integer literals in hexadecimal and octal:
  - Hexadecimal: prefix “0x”

```
hexNum = 0xBEEF     # 48879
```

  - Octal: prefix “0”

```
octNum = 0115     # 1(8^2) + 1(8^1) + 5(8^0) = 77
```

- Convert into strings with hexadecimal/octal notation:

```
hexStr = hex(48879)      # '0xbeef'
octStr = oct(77)         # '0115'
```

Bits, bytes, nibbles, words

- One hexadecimal digit can be represented by four bits: one nibble
- Two nibbles (eight bits) is called a byte
  - One byte can be used to store one CHAR
- A group of bytes can be used to represent one datum: this is called a word
  - Pentium CPUs generally use 4-byte words (32 bits)
  - Newer CPUs can use 8-byte words (64 bits)
  - Word is the smallest unit of data the machine can store or retrieve

Accessing memory

- A computer's main memory (generally, RAM) stores everythin it needs to do its current tasks
- A location within memory is uniquely identified by its address
  - Most modern CPUs use 32-bit words to store memory addresses
  - This means there is a maximum of 2^{32} unique memory addresses (the address space)
  - If each location stores one byte of data, then there is 2^{32} bytes = 4GB of addressable memory

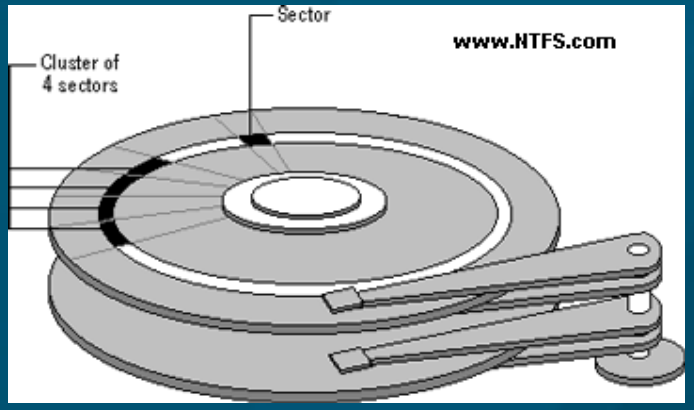
Units of measure

- SI abbreviations:
  - K = kilo = 1,000
  - M = mega = 1,000,000
  - G = giga = 1,000,000,000
- When working with binary data:
  - KB = kilobyte = 1,024 bytes = 2^{10} bytes
  - MB = megabyte = 1,024,576 = 2^{20} bytes
  - GB = gigabyte = 1,073,741,824 = 2^{30} bytes
  - But hard drive manufacturers use SI abbrevs

Units of measure, cont.

- Kilobytes vs. kilobits:
  - KB = kilobyte = 1,024 bytes = 8192 bits
  - Kb = kilobit = 1,024 bits
  - RAM chip manufacturers often use kilobits
- Also, in SI abbreviations,
  - M = mega = 10^6: e.g., megawatt = 10^6 watt
  - m = milli = 10^{-3}: e.g., milliwatt = 10^{-3} watt
- But not everyone is consistent, so be careful

Storage



- A page of memory is generally 256 bytes
- A sector is a unit of disk storage, also commonly 256 bytes (but sometimes 512 bytes)
- A block of disk storage is usually 512 bytes
- Hard disks are made up of platters, accessed by magnetic heads on movable arms
- The platters have concentric tracks that (across all heads) make up cylinders
- Hard drive geometry is often expressed in C/H/S: # cylinders / # heads / # sectors per track

Summary of today (§8.0-8.3)

- Number bases:
  - Binary
  - Hexadecimal (0xBEEF)
  - Octal (0115)
- Units of measure of memory:
  - Bits, nibbles, bytes, words, pages
- Units of measure for hard disks:
  - C/H/S geometry
- SI units vs binary units, KB vs. Kb, etc.
