Java Syntax

13 Jan 2010
CMPT166
Dr. Sean Ho
Trinity Western University

TRINITY WESTERN UNIVERSITY

What's on for today

- Info on our programming labs
- Java syntax: expressions and statements
- Coding style
- Console output and String
- If statements and booleans
- While loops and for loops
- Switch
- Labeled blocks

Class policy on IDEs

- For class purposes, you may use any IDE you feel comfortable with, **but**:
- I have to be able to re-compile+run your code!
  - There could be incompatibilities between compilers or versions of Java
  - I will be using Eclipse 3.5.1 (w/ ecj)
  - I also have Sun's JavaSE 1.6 on my laptop
- The only officially-supported setup is Eclipse 3.5.1 in the senior lab
  - *(demo Eclipse)*

CMPT166 programming labs

- CMPT166 is weighted heavily on programming labs (about 6 total)
- These are sizeable programming projects; allocate plenty of time to work on them!
- Individual work – you may discuss with your classmates, but your code should be your own
  - I'm open to team projects if you want, but the scope should expand accordingly
- Write-ups (see sample): design, libraries, variables, pseudocode(s), sample IO, test cases

Expressions and statements

- Legal identifiers: essentially same as in Python
  - Only letters, numbers, or underscore (_)
    - Also '$', but that's special
  - Must not start with number
- Expressions: composed of operators and type-compatible operands
- Statements: declare objects, call methods, or assign expressions to names

Java primitive types

- boolean (1 byte): true, false
- char (2 bytes): Unicode, '\u0000' to '\uFFFF'
- byte (1 byte): -128 to +127
- short (2 bytes): -32768 to +32767
- int (4 bytes): -2^{31} to $+2^{31}-1$
- long (8 bytes): -2^{65} to $+2^{65}-1$
- float (4 bytes): +/- 1.40129846432481707e–45 to 3.40282346638528860e+38
- double (8 bytes): +/- 4.94065645841246544e–324 to 1.79769313486231570e+308

Operator precedence

- In order from most tightly bound first:
  - Parentheses: ()
  - Unary postfix (r to l): x++, x--
  - Unary prefix (r to l): ++x, --x, +x, -x, (type) x
  - Multiplicative: *, /, %
  - Additive: +, -
  - Relational: <, >, <=, >=
  - Equality: ==, !=,
  - Conditional (r to l): ?:
  - Assignment (r to l): =, +=, -=, *=, /=, %=, etc.

Expression compatibility

- Statically typed: declare and initialize variables
  - int numApples = 5;
- Cannot assign mismatched types:
  - numApples = 3.4; // won't work!
- But values can be promoted to higher precision:
  - float appleSize;
  - appleSize = 3; // promoted from int to float
    - byte → short → int → long → float → double
- Type casting forces a type conversion:
  - numApples = (int) 3.99; // truncated to 3

Coding style

```
public class HelloWorld {
    public static void main( String args[] ) {
        System.out.println( "Hello, World!" );
    }
}
```

- Class names are nouns in CamelCase
- Method names are usually verbs in lowercase:
  - useLowerCamelCase() or use_underscores()
- Local variable names are also lowercase
- Constants: ALL_UPPERCASE

Text output: System.out

- System is a class in the java.lang library
- java.lang is automatically imported
  - Can import other libraries with import
- System.out is the standard output file object
- Its methods include print and println:
  - System.out.println(“Hello!”);
  - System.out.print(“Hello!\n”);
- Other escape characters:
  - Tab (\t), backslash (\\), quote (\")

Standard Java class String

- Not a primitive type in Java (unlike Python)
- String class, instantiate with literal strings:
  - String motto = “We aim to please”;
- Concatenation: overload “+” operator
  - System.out.println(motto + “ you!”);
- Other string operators:
  - motto.length()
  - motto.equals(“We aim to wheeze”)
  - motto.equalsIgnoreCase(“we aim to PLEASE”)
  - motto.toLowerCase()
  - more! See book p.38-41.

If and Booleans

- if (*condition*) *statement*;
- Condition is of type boolean
  - Literals: true, false
  - Binary operators: ==, !=, <, >, <=, >=,
  - Boolean operators (shortcut): &&, ||
- Compound statement using {}:

```
if (condition) {
    statement1;
    statement2;
}
```

Selection: if ... else ...

```
if (condition)
    statement1;
else
    statement2;
```

- How to do elif?

```
if (condition)
    statement1;
else if (condition2)
    statement2;
```

The “dangling else” problem

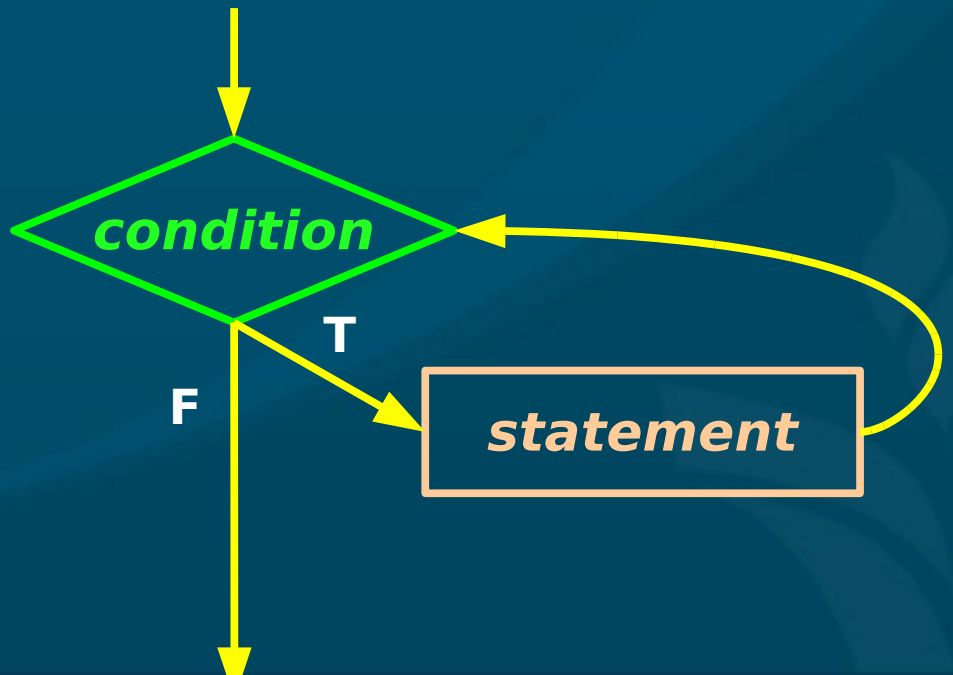
```
if (cond1)
    if (cond2)
        statement1;
else
    statement2;
```

- Which if is the else attached to?
- Solution: always use braces

```
if (cond1) {
    if (cond2) {
        statement1;
    }
} else {
    statement2;
}
```

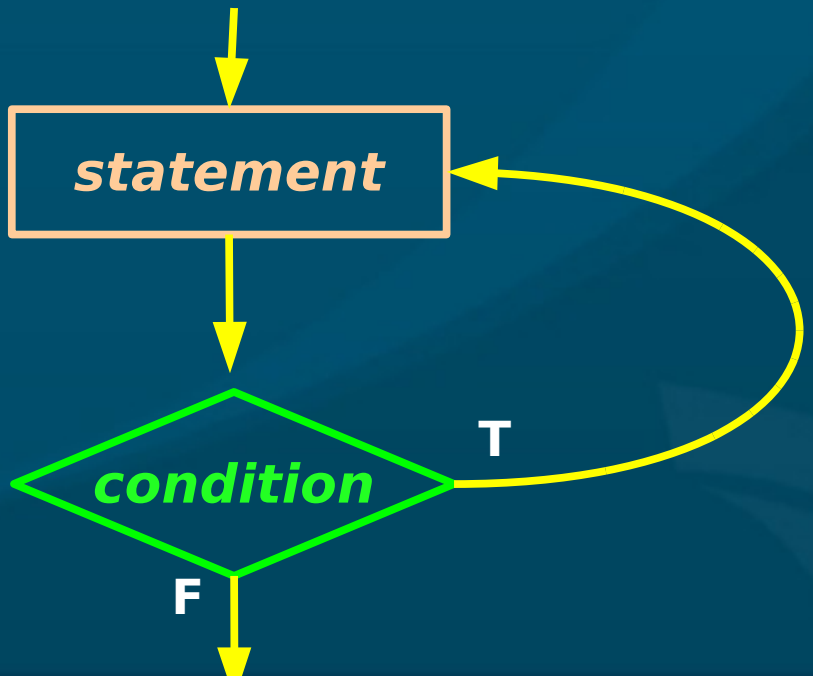
While loops

- while (*condition*) *statement*;
- As usual, statement can be a { } block
- *condition* evaluates to a boolean
- Top-of-loop testing



do/while loops

- do *statement* while (*condition*);
- As usual, statement can be a { } block
- *condition* evaluates to a boolean
- Bottom-of-loop testing



For loops as while loops

- Pretty much every for loop:
  - for (*init*; *condition*; *increment*) *statement*;
- ... can be expressed as an equivalent while loop:
  - *init*;
  - while (*condition*) {
    - *statement*;
    - *increment*;
  - }

break/continue

- Use break to terminate a loop early:
  - for (i=0; i<10; i++) {
    - if (i==5) break; // quit at 5
  - }
- Use continue to skip to the next iteration of the loop:
  - for (i=0; i<10; i++) {
    - if (i==5) continue; // don't print 5
    - System.out.print(i);
  - }

Switch statement

- switch (*expression*) {
  - case *val1*: *statement; ...;* break;
  - case *val2*: *statement; ...;* break;
  - *...*
  - default: *statement; ...;*
- }

- Similar to a nested if/else structure
  - But *expression* is only evaluated once
- If omit a break, execution continues next case:
  - case *val1:*
  - case *val2*: *statement; ...;* break;

Labeled blocks

- Blocks can be named
- break/continue can specify a name:
  - Go to start/end of named block

```
main: {
        for (row=0; row<n_rows; row++) {
            for (col=0; col<n_cols; col++) {
                if (row+col == 12) break main;
            }
        }
}
```

TODO

- Lab0 (due Mon): “Hello, World!”
  - Get familiar with a Java development environment: Eclipse, NetBeans, or other
  - Write a simple “Hello, World!” program
  - Nothing to turn in
- Lab1 (due Mon 25Jan): Control/Flow
  - Savitch text, pp.162-164. Choose one of:
  - #2: game of craps
  - #5: loan calculator
  - #8: cryptarithmetic puzzles
