# Quiz 1: 10min, 20pts

- Contrast the **JRE** with the **JDK**. [4]
- Name the 8 **primitive types** built-in to Java, and contrast them (what's the difference?) [8]
- Write a Java function **numHashes()** that takes an integer parameter and prints that many **hash marks** (“#”) to the screen: [8]
  - ◆ **numHashes(5); // outputs: “#####”**
  - Include a **docstring** and **pre/post-conditions**.

# Quiz 1: answers #1-2

- Contrast the **JRE** with the **JDK**. [4]
  - **JRE**: Java Runtime Environment: enough to **run** precompiled Java applications (java)
  - **JDK**: Java Development Kit: JRE + enough to write+**compile** your own (javac+java)
- Name the 8 **primitive types** built-in to Java, and contrast them (what's the difference?) [8]
  - **boolean** (true/false), **char** (Unicode)
  - **byte** (1), **short** (2), **int** (4), **long** (8)
  - **float** (4), **double** (8)

# Quiz 1: answers #3

- Write a Java function `numHashes()` that takes an integer parameter and prints that many hash marks (“#”) to the screen: **[8]**
  - ◆ **/\*\* Print given number of hashes.**
  - ◆ **\* @param num Number of hashes to print.**
  - ◆ **\* @return Doesn't return anything (prints). \*/**
  - ◆ **public void numHashes( int num ) {**
    - **for (int i=0; i++; i<num) {**
      - **System.out.print(“#”);**
    - **}**
    - **System.out.println();**

◆ }

# Some handy Math methods

- Class methods in `Math` module
  - `sqrt(x)`
  - `abs(x)`
  - `max(x, y)`, `min(x, y)`
  - `ceil(x)`, `floor(x)`
  - `cos(x)`, `sin(x)`, etc.
  - `exp(x)`, `log(x)` (natural log)
  - `pow(x, y)` (y can be a float)
  - `random()` (double in range `[0, 1)` )

# Some handy standard packages

- `java.lang`: automatically imported
- `java.io`: files and streams
- `java.net`: networking
- `java.text`: manipulate strings, dates, i8n
- `java.util`: miscellaneous utilities: strings, etc.
  
- `java.applet`: or `javax.swing.JApplet` for Swing
- `java.awt`: or `javax.swing`
- `java.awt.event`: or `javax.swing.event`

# static keyword

- ◆ `public static void main( String args[] ) {`
- **static** keyword: **class attribute**
  - **Shared** by all instances of this class
  - ◆ vs. **instance** attribute: **separate** for each object
    - Exists **before** class is instantiated
  - ◆ Invoke **class methods** as: `ClassName.method()`
- **Running** a class vs. **instantiating** a class:
  - **Run** a class from JRE: `java MyClass`
  - ◆ No instances made, just `MyClass.main()` invoked
    - **Instantiating**: `new MyClass()`
- ◆ **Constructor** is run, **main()** is not run

# static import

- ◆ `import static java.lang.Math.*;`
- Import all **static** members of a class
- Brings static variables/methods into current **namespace**:
  - ◆ `sqrt( 36.0 );` instead of `Math.sqrt( 36.0 );`
  - ◆ `log( E );` instead of `Math.log( Math.E );`
- Can also bring in **one** particular member:
  - ◆ `import static java.lang.Math.sqrt;`

# Scope and duration

- The **duration** (lifetime) of an identifier is the runtime period **when** it exists in memory
  - **Automatic** duration
    - ◆ **Local** variables disappear when block finishes
  - **Static** duration
    - ◆ As long as the **object**/module/program exists
- The **scope** of an identifier is the lexical extent **where** it can be referenced
  - **Block** scope
  - **Class** scope

# Scope example

```
public class ScopeExample {  
    int numApples = 0;        // class scope  
    public void listApples() {  
        int counter = 0;     // block scope  
    }  
}
```

- `numApples` is an **instance** variable with **class** scope: accessible to all **methods** of this class
- `counter` is a **local** variable with **block** scope: not accessible outside the `listApples()` method
